YEKTA light

INSTALLATION GUIDE

Install in Photoshop

Windows and macOS. One file — **YektaLight.ccx** — installs the Yekta Light panel into Adobe Photoshop.

REQUIREMENTS

Before you start

- Adobe Photoshop **2022 (version 23.3) or newer** — Windows or macOS.
- The **Creative Cloud desktop app**, signed in (it installs plugins).
- The file `YektaLight.ccx` (about 0.9 MB).

METHOD A · RECOMMENDED

Double-click install

1. Quit Photoshop if it is open.
2. Double-click `YektaLight.ccx`. The Creative Cloud app opens and asks to install the plugin.
3. Creative Cloud warns that the plugin does not come from the Adobe Marketplace. This is expected for plugins downloaded from a website — click **OK / Install** to continue.
4. Wait for *"Installation successful"*.
5. Start Photoshop and open **Plugins ▸ Yekta Light ▸ Yekta Light**. The panel appears; drag its tab into your panel dock wherever you like.

> Photoshop remembers where you docked the panel. Next time it opens with your workspace.

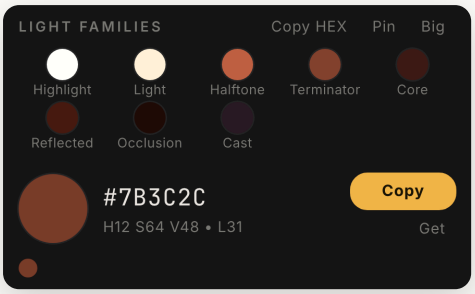

METHOD B · DEVELOPERS

UXP Developer Tool

1. Install the free **UXP Developer Tool** from the Creative Cloud app and enable Developer Mode when it asks.
2. Unzip the plugin folder `YektaLight-Photoshop`.
3. In the tool choose **Add Plugin** and select `manifest.json` inside that folder, then click **Load**.

FIRST USE

Connect it to your brush

Pick bar: Set FG, BG, Get, Follow FG

1. Click anywhere on the 3D form. With **Live** on, the lit color becomes your Photoshop **foreground color** instantly.
2. **Set FG** sends the picked color again; **BG** sets the background color.
3. **Get** loads Photoshop's current foreground into the selected color target (for example your skin base color).
4. **Follow FG**: every time you change the foreground in Photoshop (eyedropper, color picker, X, D), the form updates to preview that color under your light.
5. **+ Swatches** adds the eight light-family colors to Photoshop's Swatches panel.

UPDATE & REMOVE

Managing the plugin

- **Update:** double-click the newer `YektaLight.ccx`; it replaces the old version.
- **Uninstall:** Creative Cloud app ▸ **Stock & Marketplace / Plugins** ▸ **Manage plugins** ▸ Yekta Light ▸ **Uninstall**. (Photoshop's own *Plugins ▸ Manage Plugins…* opens the same page.)

TROUBLESHOOTING

If something is off

PROBLEM	FIX
Panel not in the menu	Restart Photoshop after installing. Check the version is 23.3 or newer (Help ▸ About Photoshop).
Install blocked	Make sure you are signed in to Creative Cloud. On managed (company) computers an admin may have disabled third-party plugins.
Color does not change	Close any open Photoshop dialog (Color Picker, Save…) — Photoshop accepts the new color once the dialog is closed.
Panel feels slow	Make the panel narrower or shorter — the 3D view renders at the panel size. Rendering is sliced so Photoshop itself never freezes.
